## Angle or Globe Pattern

Cup Disc Type
Steam, Air, Water, Oil Service

TYPE 135 ANGLE

TYPE 145

CUP DISC, SEAT-BUSHING
faces upstream, the velocity head of the entering fluid is changed into additional pressure to lift the cup. The tube may extend outside the valve to transmit pressure from a remote point.
A close fitting sleeve surrounds the cup to prevent pressure in the outlet chamber from acting downward on the cup and raising the inlet pressure.

A vent in the spring housing prevents an accumulation of pressure above the disc.
Since there is always some fluid leakage between the sleeve and the cup, this vent connection should be piped back to the reservoir when liquids are used. The piping should be kept as short as possible to avoid pressure buildup above the cup.

When used as a relief valve without the sleeve and vent, the capacities are reduced
as indicated in the table. The smoother and more chatter free characteristics of the cup construction are retained.
Although the spring can be designed for a wide range of adjustment, much better regulation results if the spring is specified and designed for a definite pressure with a moderate adjustment range. The cap locks the adjusting screw and prevents leakage.

Capacity: The outstanding advantage of this valve is its very large capacity with excellent regulation at all rates of flow. The size ordinarily is half the size required with other types.

Materials: Sizes $11 / 2$ inch and smaller have bronze body and trim. Larger sizes have cast iron body and bronze trim. Prices for valves made of other materials will be supplied on request.

TYPES 135 AND 145-DIMENSIONS—WEIGHTS (approximate)

## TYPES 135, 145 BACK PRESSURE VALVES

## Capacity Table

The maximum capacity of any back pressure valve depends on its size and on the inlet and outlet pressures at the maximum rate of flow. The capacity depends also on the type and design of control mechanism. It is necessary to have all this information to figure the capacity accurately.
Although a very large capacity can be obtained from any back pressure or relief valve if the inlet pressure rises enough, only the capacity obtainable with a moderate and safe pressure rise is important.

The capacities of valves in this bulletin are based on $10 \%$ rise or accumulation in inlet pressure above the set opening pressure, except Type 135 based on $5 \%$ rise.

## Don't base your selection of valve size merely on size of pipe.

## 1. To find Valve Capacity - Multiply Capacity Factor by Orifice Capacity.

2. To find Valve Size needed - Divide Required Capacity by Orifice Capacity to obtain Capacity Factor. Then use Table No. 1.

## Capacity Factors in Table No. 1

 represent the capacity of each valve, with good regulation, as compared to the capacity of a standard orifice under the same conditions.
## Orifice Capacities in Tables Nos.

2, 3, 4 and 5 are the rates of flow through a perfect ( $100 \%$ coefficient) orifice or nozzle of 1 sq . in. area for various combinations of inlet and outlet pressures.
Corrections for superheat and for fluids of different specific gravities are shown.
Maximum inlet temperature $450^{\circ} \mathrm{F}$.
Example: Find steam capacity of 3" Type 135 Inlet pressure 20 lbs. -Outlet 8 lbs. or lower. Capacity Factor = 2.4 (See Table No. 1). Orifice Capacity $=1,900 \mathrm{lbs}$. per hr. (Table No. 3). Valve Capacity = $2.4 \times 1,900=4,560 \mathrm{lbs}$. per hr. steam.

|  | $3 / 8$ | $1 / 21$ | 3/4" | 1" | $11 / 4 "$ | 11/2" | 2 " | 21/2" | 3" | 4" | 5" | $6 "$ | 8" | 10" | 12" | 14" |
